

#### Question 4

Let say we have Bucket name as Student in which all the documents will have the Student name always.

So instead of using PRIMARY INDEX we can use Student name as index for the bucket as follows :-

**>CREATE INDEX StudentNameIndex ON Student(StudentName) USING GSI;**

Where:

Student: Name of Bucket

StudentName: Name of field which is made as Primary Index

StudentNameIndex: Name given to the index, which can be used to drop this constraint(if required).

To drop the constraint

**>Drop index BucketName.IndexName**

for above example: **>Drop index Student.StudentNameIndex;**
